

14th August 2008

Quarterly National Accounts – Flash Estimate

2nd Quarter 2008

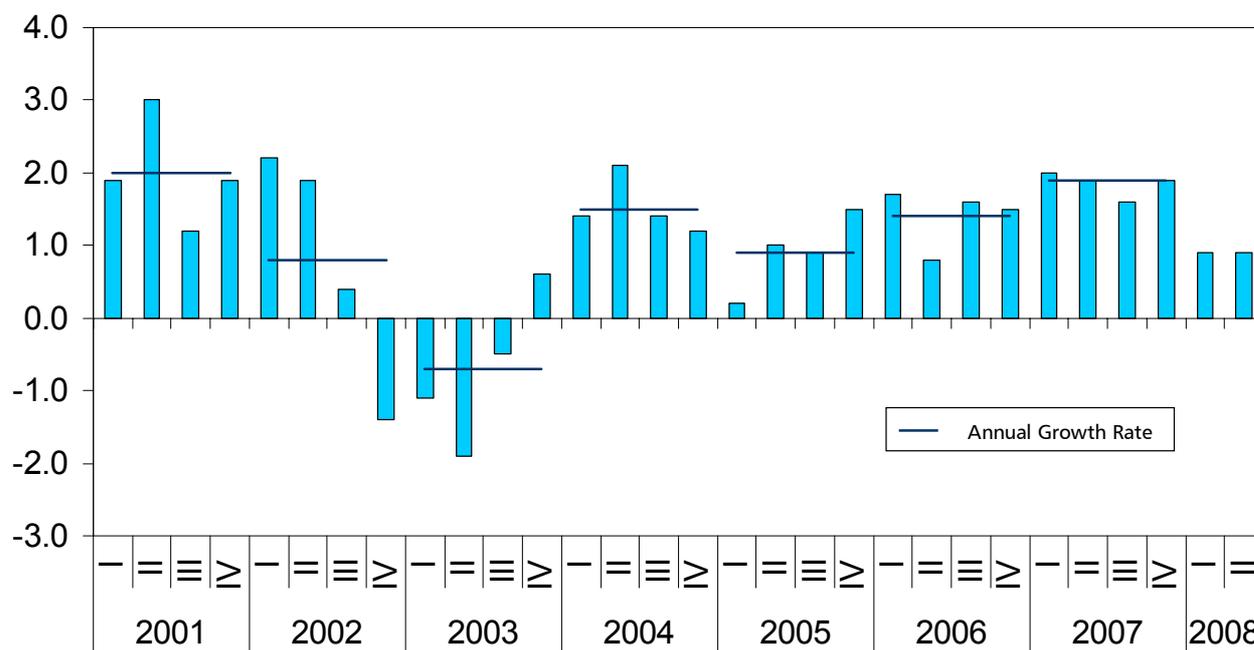

GROSS DOMESTIC PRODUCT UP BY 0.9% IN REAL TERMS IN THE 2ND QUARTER 2008

Portuguese Gross Domestic Product (GDP) grew 0.9% in volume in the 2nd quarter 2008, comparing to the same quarter of the previous year, the same result as in the previous quarter. The first estimate for the quarter-on-quarter change rate on the Portuguese GDP points to an increase of 0.4%.

Gross Domestic Product

Chain-linked volume data (reference year=2000)

Year on year quarterly growth rate, %

The flash estimate of Portuguese GDP growth rate for the 2nd quarter 2008 includes revisions of the results for the previous quarters, reflecting the introduction of the definitive results from Annual Accounts for 2006 and the newest base information available. In particular it incorporates the latest versions of the Balance of Payments statistics and of the external trade of goods statistics.

This led to an upward revision of the annual growth rate on Portuguese GDP of 0.1 percentage points (p.p.) for 2006 and 2007 compared to the previous figures. For the 1st quarter 2008, the year-on-year quarterly growth rate was maintained at 0.9%.

Gross Domestic Product

* - preliminary data

Next Press Release of Quarterly National Accounts

Current estimates of Quarterly National Accounts (detailed results) for the 1st quarter 2008 will be published 9th September 2008.

Methodological information about flash estimates

Flash estimates for GDP constitutes the first synthetic indication on the quarterly behaviour for the Portuguese economy and does not replace the main estimates of Quarterly National Accounts (also designated as current estimates), more accurate and detailed, which will be published 70 days after the end of the reference quarter.

These flash estimates are calculated using the same methodology, and preferably the same basic information, compared to the Quarterly National Accounts current estimate. The percentage of basic information available for flash estimates is over 80%. Methods for imputation and forecasting are used in those cases where basic information is not complete, selected after a series of tests performed over a large sample. One must take into consideration that these flash estimates are eventually subject to larger revisions (when compared to current estimates), although the percentage of basic information available is high.

This press release only includes information on quarter-on-quarter and year-on-year quarterly growth rates in real terms.

In the real time tests carried out from 2nd quarter 2005 onwards, the mean absolute error for the flash estimate was 0.1 percentage points for both year-on-year quarterly growth rate and quarter-on-quarter growth rate, when compared to the current estimate.

Growth rates included in this press release are calculated from chain linked volume data (2000=100). Data is seasonally adjusted.
